

Addressing climate change

What is the issue?

\n\n

Recent scientific community reports has attributed unplanned urbanisation for climate change and natural disturbances.

\n\n

What are the findings of recent scientific reports?

\n\n

\n

- The global temperature since 1860 is observed to have risen by 0.4 centigrade.

\n

- Besides, there have been increases in the ocean temperature by 0.10 centigrade (0-700 metre depth) during 1961-2003.

\n

- The temperature rise is attributed to anthropogenic reasons, resulting from carbon emissions and urbanisation.

\n

- The South Asian Region (SAR) comprising Afghanistan, Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan, and Sri Lanka, is more exposed to regional and global climatic threats.

\n

- This will be a greater challenge for sustainable economic development of these countries.

\n

\n\n

What are the impacts of climate change?

\n\n

\n

- 74 per cent of all natural calamities being hydro-meteorological ones, which arise out of the impact of the monsoon and cause maximum damage.

- \n
- It will manifest the increases in the frequency and intensity of floods, tropical cyclones, heat waves and drought.
- \n
- Besides the degradation of ecosystems, reduced availability of food and drinking water, and other impacts on the livelihoods of communities.
- \n
- It creates a shortage of potable water, besides creating health risks due to respiratory and faecal-oral factors, particularly for people in slums.
- \n

\n\n

What measures need to be taken?

\n\n

- \n
- Climatic Smart Urban Planning should be encouraged by way of developing the “climate smart” (a word coined in the IPCC report) infrastructure.
- \n
- It should emphasises combining pro-poor development and climate change adaptation and mitigation.
- \n
- Urban planners need to account for the new demands due to settlements coming up in different geographical locations on account of migration.
- \n
- Policymakers need to shift from the existing paradigm of response only when disasters happen to all facets of disasters.
- \n
- Adopting Multi-Risk Resilient Structural Designs is key for countries of South Asia, besides integrating Climate Change & Urban Adaptation.
- \n
