

Ailing India Navy

What is the issue?

\n\n

India's navy is beginning to see the end product of decades of confusion and a continuing neglect of strategic planning.

\n\n

How vulnerable is India's Navy?

\n\n

\n

- With the decommissioning of INS Viraat, India is down to a single aircraft carrier.

\n

- Meanwhile, the People's Liberation Army (Navy) of China will soon have two of these, its existing Liaoning, and the Shandong, which is to be officially launched shortly.

\n

- China, which already outclasses India in terms of the number of its submarines, will soon have more aircraft carriers, too.

\n

- China has clearly learned from India's worrisome carrier-first strategy, which had cost India very dearly.

\n

- Recently, the Navy indicated that the indigenous light combat aircraft, Tejas, was not suitable for carriers because it was "too heavy".

\n

- But the MiG-29s which Indian carrier's house is known to be problematic and unreliable.

\n

- India also overpaid Russia for INS Vikramaditya; and INS Vikrant is eight years behind schedule.

\n

- It will only be fully operational by 2023 when it was supposed to be completed by 2015.

\n

- It has been reported that the Indian Navy nevertheless intends to commission INS Vikrant by 2018 without its “aviation complex”, or flight operations control.
\n
- It might not even have LR-SAM anti-ship missiles at that point.
\n
- Launching an aircraft carrier without crucial offensive or defensive weaponry is a truly mystifying decision.
\n
- Two new Scorpene submarines INS Kalvari and INS Khandari made in Mazagon Docks are to be launched this year.
\n
- Both are undergoing sea tests, but they have essentially no anti-sub torpedoes, since the Black Shark systems they were supposed to be fitted by an Italian conglomerate has been blacklisted.
\n
- The fate of the 98 Black Sharks to be bought continues to be uncertain.
\n
- The Scorpene's essential data was reportedly leaked last year that may make them easier to identify adds more worries.
\n
- It is also being reported that none of the six Scorpene's planned will have air-independent propulsion, which extends endurance.
\n
- The last two were supposed to have it, but DRDO, missed its deadline for integration.
\n
- The level of the crisis should be clear from the fact that India has only 13 conventional submarines in service, of which 11 are older than 25 years.
\n
- As for nuclear submarines, India is living essentially on loans from Russia; the Akula II-class INS Chakra is leased for 10 years, till 2022.
\n
- China may have about 70 submarines, as compared to India's 15; but India's fleet is short even of anti-submarine helicopters.
\n
- Over two dozen ships have only 26 obsolete medium multi-role helicopters.
\n
- The light utility helicopters, Chetaks, also need to be replaced in their dozens.
\n
- INS Kolkata was commissioned in 2014 without Barak-8 air defence

missiles and towed array sonars.

\n

- Fixing these gaps is not just a question of money, but also of careful thought and planning.

\n

- But clearly this is not a priority for the government – after all, there isn't even a full-time defence minister.
