

## **Approach in poverty alleviation**

### **What is the issue?**

\n\n

\n

- India's record of reducing poverty is not very encouraging in comparison to many developing countries.

\n

- This calls for a reassessment of the approach to poverty reduction efforts.

\n

\n\n

### **How has India's record been?**

\n\n

\n

- India extricated 120 million people from extreme poverty between 1990 and 2013; however the process was relatively slow.

\n

- Over the same period, China reduced the number of people living in extreme poverty from 756 million to 25 million.

\n

- Growth elasticity of poverty reduction i.e. the impact of economic growth on poverty reduction is also very weak in comparison to many high growth countries.

\n

- Despite many initiatives in this regard, the results are being diluted by the conditions of rising inequalities.

\n

\n\n

### **What should be done?**

\n\n

\n

- An essential element in any poverty alleviation strategy is the prevention of large declines in household incomes.

\n

- State-sponsored anti-poverty and social protection schemes should come with the right understanding.  
\n
- Conditional Cash Transfers (CCTs) have been proposed as an effective instrument in alleviating poverty in many countries.  
\n
- Above addressing poverty, CCTs have longer term results through behavioural changes in households.  
\n
- Importantly, encouraging investment in the human capital of poor children can only break the inter-generational transmission of poverty.  
\n
- This translates to quality and equal educational opportunities, accessible and affordable health infrastructure  
\n
- The idea of Universal Basic Income in the latest Economic Survey is positive, but focusses more on reducing poverty.  
\n
- However, there is a need to build the **social infrastructure** capable of providing quality education, health, and nutrition to reap full benefits.  
\n
- A well-functioning social infrastructure is thus a prerequisite for CCTs and other such measures in reducing poverty.
