

## Artificial Intelligence-based Pollution Sensors

### Why in the news?

*AI-powered air sensors offer a cost-effective, real-time, and practical way to monitor air pollution and protect public health.*

#### Global Status of Air pollution

- Globally, air pollution causes 7 million deaths per year.
- Air pollution is the **2<sup>nd</sup> leading global risk** factor for death, contributing to 8.1 million deaths annually.
- Every day, 100 children under five die in East Asia and the Pacific due to air pollution.
- 99% of the population breathing air exceeds World Health Organization (WHO) guideline limits, leading to
  - 8.1 million premature deaths annually, and shortening average life expectancy by 2.2 years.
- Fine particulate matter (PM2.5) and nitrogen dioxide (NO<sub>2</sub>) are key pollutants of concern.
- Children are highly vulnerable due to their developing lungs, weak immune systems, and faster breathing rates.
- The burning of fossil fuels is the biggest cause of air pollution and also contributes to climate change.

### New AI-Driven Roaming Sensors

- Compact air sensors are the size of a thick mobile phone and cost a few thousand pounds.
- These sensors can be attached to vehicles like buses, vans, and garbage trucks to collect real-time data.
- They measure **pollutants** such as:
  - Particulate matter (soot)
  - Carbon monoxide
  - Ozone
  - Nitrogen dioxide
  - Sulphur dioxide
- These sensors **send data every minute** to a central system.
- **Advantages** - Affordable and practical alternative to expensive monitoring stations.
- Provides real-time air quality maps in local areas.
- Helps identify pollution sources and plan emergency measures.
- Can guide individuals to safer areas (e.g., joggers choosing cleaner routes, parents finding safer playgrounds).
- Ensures better air quality awareness and health protection for the public.

*Right to breathe clean air is a fundamental right under Article 21.*
