

Black Kite

Why in News?

Recently, an article suggested that black kites have nesting habitats at a tower structure in Chennai.

- **Black Kite** It is a bird of prey and a *migratory bird* extends to an extremely large range of habitats.
- Scientific Name Milvus migrans.
- It is often called Fork-Tailed Kites.
- **Habitat** Close access to water bodies such as rivers, ponds, lakes, and wetlands, woodlands, grassland and open savannas.
- Distribution Tropical portions of Australasia, Eurasia, and Africa.
- **Morphology** Medium-sized raptors, dorsal, ventral and tail color is brown with darker brown striped feathers within.
- It has small, bead-like dark brown eyes and a large black, hook-shaped beak, long black talons and pale-yellow legs.

• Sexual dimorphism

- **Female** It has a slightly *larger body size than males*, though they feature similar coloration.
- Characteristic It typically lives in social groups.
- It migrates from Europe and northern Asia wintering in sub-Saharan Africa and southern Asia.
- It has well developed intraspecific communication and very loud vocalizing.
- **Diet** An extremely *versatile feeder*, it takes carrion, birds, mammals, fish, lizards, amphibians, invertebrates and forage on vegetable matter such as palm oil fruits.

- Threats Poisoning
 - Shooting
 - Electrocution by power lines
 - Pollution of water by pesticides and other chemicals
 - Vulnerable to the effects of wind energy development.
- Conservation Status
 - IUCN Least Concern.
 - **CITES** Appendix II.
 - Wild Life Protection Act, 1972 Schedule-II.
