

Carbon-Dioxide Removal

Why in news?

As nations gather for the [COP 28](#) in Dubai, the question of carbon capture's future role in a climate-friendly world will be in focus.

What is Carbon Dioxide Removal (CDR)?

- **Carbon removal**- Using technologies, practices, and approaches to remove carbon dioxide (CO₂) from our atmosphere through deliberate and intentional human actions.
- It captures CO₂ from the atmosphere and locks it away for decades or centuries in plants, soils, oceans, rocks, saline aquifers, depleted oil wells, or long-lived products like cement.

- **Process**- CDR can be done through traditional or technological processes or both.

Process	Examples
Traditional process	<ul style="list-style-type: none"> • Afforestation • Reforestation • Agricultural practices that sequester carbon in soils (carbon farming)
Technological process	<ul style="list-style-type: none"> • Bioenergy with Carbon Capture and Storage (BECCS) • Direct Air Carbon Capture and Storage (DACCS) • Enhanced rock weathering

- **Forms of CDR**- The most common form of carbon capture technology involves capturing the gas from a point source like an industrial smokestack.
- **Carbon storage**- It includes
 - **Carbon capture and storage (CCS)** - The carbon can be moved directly to permanent underground storage.
 - **Carbon capture, utilization, and storage (CCUS)** - Carbon can be used in another industrial purpose first.

As of 2023, CDR is estimated to remove around 2 gigatons of CO₂ per year, which is equivalent to 4% of the greenhouse gases emitted per year by human activities.

What are the different CDR methods?

CDR method	About	Challenges
------------	-------	------------

Afforestation/ Reforestation	<ul style="list-style-type: none"> • Converts abandoned or degraded agricultural lands into forests. • Additional trees can sequester more carbon dioxide from the atmosphere. 	<ul style="list-style-type: none"> • Increases the competition for land. • May limit the options for food production and biodiversity conservation.
Biochar	<ul style="list-style-type: none"> • A substance produced by <u>burning organic waste</u> from agricultural lands and forests in a controlled process called <u>pyrolysis</u>. • Improve soil quality, which in turn improves soil fertility, productivity and crop yield. 	<ul style="list-style-type: none"> • Health and environmental impacts of particulate matter produced during pyrolysis. • Sourcing sustainable biomass at a scale.
BECCS	<ul style="list-style-type: none"> • Combines energy production, biological carbon removal and geological storage. • Uses biomass in combustion to generate energy, then captures the emitted carbon for geological injection. 	<ul style="list-style-type: none"> • Can create <u>competition for land use</u> with food production, placing pressure on food security. • Can increase the use of fertilisers.
DACCS	<ul style="list-style-type: none"> • <u>Extracts CO₂ directly</u> from the atmosphere, and is permanently stored in geological formation or used for other application. 	<ul style="list-style-type: none"> • Accelerates fossil fuel extraction activities, potential CO₂ leakage from storage sites
Enhanced rock weathering	<ul style="list-style-type: none"> • Involves <u>pulverising silicate rocks</u> to bypass the conventionally slow weathering action. 	<ul style="list-style-type: none"> • Energy intensive process and generates emissions.
Ocean alkalinity enhancement	<ul style="list-style-type: none"> • A <u>chemical removal method</u> that involves adding alkaline substances to seawater to accelerate the natural sink. 	<ul style="list-style-type: none"> • Potential for <u>increased greenhouse gas emissions</u> and can <u>release by-products</u> like trace metals.

✖ What lies ahead?

- CDR methods require appropriate governance and policies as they can cause adverse side-effects apart from the predicted benefits.
- The need of the hour is to accelerate research and development and incentivise CDR deployment, a political commitment, including reliable measurement, reporting, and verification of carbon flows as recommended by IPCC.
