# Challenges in Biofuel Susitainability

## Why in news?

India has launched the Global Biofuel Alliance in G20 summit 2023, demonstrating its commitment to climate action with global cooperation.

| Global Biofuels Alliance |
|---|
| • **About**- It is an initiative to develop an alliance of governments, international organisations and industry to facilitate the _adoption of biofuels_.<br>• **Origin**- _India, Brazil, United States_ will work together for the development of alliance<br>• Brazil, India and the US contribute about _85%_ of the world's biofuel production.<br>• _19 countries and 12 international organisations_ have joined the GBA<br>• **Aim-** To facilitate cooperation and intensify the use of sustainable biofuels, including in the transportation sector.<br>• It will place emphasis on<br>  - Strengthening markets, facilitating global biofuels trade and developing concrete policy lesson-sharing<br>  - The already implemented best practices and success cases.<br>• It will work in collaboration with the relevant existing agencies as well as initiatives such as<br>• The Clean Energy Ministerial Bio-future Platform,<br>• The Mission Innovation Bioenergy initiatives, and<br>• The Global Bioenergy Partnership (GBEP) |

## What is Biofuel?

- Biofuels are liquid fuels produced from _renewable_ biological sources, including plants and algae.

| Generation | Source | Example |
|---|---|---|
| **First generation (1G)** | Conventional source or food sources - Sugarcane, corn etc., | Bioethanol, biodiesel, biogas |
| **Second generation (2G)** | Non-food sources and the waste left from the food resources- Municipal solid waste, wood chips etc., | Cellulose ethanol, biodiesel |
| **Third generation (3G)** | Algae- It consists of 40% of lipids which can be converted to biodiesel or synthetic petroleum. | Butanol, Gasoline, Jet fuel |
| **Fourth generation (4G)** | Produced from genetically engineered bio algae | |

## What is the significance of Biofuel?

- **Eco-friendly-** It is alternative to the fossil fuel which is a non-renewable source.
- **Reduce emission-** It have gained worldwide popularity, contributing to meet _net zero carbon emission targets_.
    - Reports say that ethanol reduces Greenhouse Gas Emissions (GHG) up to 65%.
- **Reduce import bill**- It help in reducing energy imports, on which the country depends for a large part of its oil and natural gas requirements.
- **Fuel economy**- Vehicles that run on biodiesel get 30% better fuel economy than gasoline-powered vehicles.
- **Economic development-** International Food Policy Institute (IFPI) has said that ethanol made from a shrub called cassava can help reduce poverty in that West African nation where 80% of the labour force is farmers.
- **Sustainable biofuel**- They are produced from crop residues and other wastes, with low water and GHG footprint

## What are the challenges faced by India?

- **Dependence on 1G-** The policy target in India of achieving 20% ethanol blending with petrol (E20) by 2025-26 is expected to be met almost entirely by 1G ethanol made from sugar cane and food grains.

- **Supply chain bottlenecks-** 2G is unlikely to contribute much to achieving E20 target due to several challenges related to feedstock supply chain and scaling up
- **Food security**- India's crop yields have already stagnated, and global warming is expected to reduce yields, India's strategy to meet blending targets cannot depend on surplus crop production.
- **Groundwater depletion**- Recent study led by the University of Michigan projected that the rates of groundwater depletion could triple during 2040-81 compared with the current rate.
- **Increase in GHG emissions**- Increasing GHG emission from the agriculture for fuel production is not sustainable option.
- **Reliance on sugarcane**- It is a remunerative crop that has more to do with government intervention than anything else.
- **Economies of scale**- Balancing economies of scale with the energy needs and costs of biomass collection and transportation across large distances is major challenge.

## What lies ahead?

- **Prioritise Biomass**- The Energy Transitions Commission, in its report on 'Bio resources within a Net-Zero Emissions Economy', recommended that biomass should be prioritised for use in sectors where there are limited low-carbon alternatives.
- **Net zero emission**- According to the International Energy Agency, to achieve *net-zero emissions by 2050* globally, sustainable biofuel production needs to *triple by 2030* to fuel modes that have few other mitigation options.
- **Sustainable fuel**- Although 1G ethanol is unlikely to fit the bill, 2G ethanol could be counted as a sustainable fuel, especially if the production is decentralised, i.e., crop residues do not have to be transported large distances to a central manufacturing plant.
- **Innovation-** The Global Biofuels Alliance could help drive innovation and technology development in establishing an *efficient biomass supply chain* and smaller-scale decentralised biofuel production units.

| Steps taken by India to promote Biofuel Production |
|---|
| • **E5 program**- It was India's pilot project of 5% ethanol belnding.<br>• **National Biodiesel Mission**- It was formulated in 2003 to achieve 20% biodiesel blend by 2011-12.<br>• **National Policy on Biofuel-** It was launched in 2009, proposed a non-mandatory target of 20% blending of both biodiesel and bioethanol by 2017.<br>• The policy is revised in 2018 to achieve 20% bioethanol blending and 5% biodiesel blending by 2030.<br>• **GST**- Goods & Service Tax (GST) on ethanol meant for EBP Programme has been reduced from 18% to 5%.<br>• **SATAT scheme**- Sustainable Alternative towards Affordable Transportation Initiative (SATAT) encourages entrepreneurs to set up CBG plants, produce & supply CBG to Oil Marketing Companies (OMCs) for sale as automotive & industrial fuels.<br>• **PM JI-VAN Yojana**- It was launched in 2018 to provide Viable Gap Funding for 2G bioethanol. |
