China Embraces Big-Data

What is the issue?

\n\n

\n
- Mobiwik recently published a report that extensively used Big-data analytic tools.
\n
- China seems to be racing ahead in the Big-data business.
\n

\n\n

How does the Big-data landscape look in China?

\n\n

\n
- China is already capitalising big data for solutions in areas like policing, education, urban planning & traffic management.
\n
- Chinese government feels that the full potential of big data remains unrealised due to low-level sharing of resources.
\n
- Hence, it is even working on establishing industry standards that will facilitate seamless sharing.
\n
- Their aim is to triple the scale of China's big data industry by 2020 to foster new economic growth.
\n

\n\n

What was the Mobiwik report?

\n\n

\n
- Mobike is one of the largest share-cycle service providers in China.
\n
- It recently released a white paper on its service, which studied the impact biking on the economy, urban transport, environment and living standards.

- The report had done an extensive quantitative and qualitative analysis of Mobike's vast trove of travel data.
- It provided remarkably detailed insights on the behavioural patterns of various social groups broken down to clear specifics.

How does the future look?

- Big-data can bring in revolutionary changes in decision making.
- While concerns about privacy & data abuse are indeed real, completely shunning big-data can't be the solution.
- We therefore need to develop robust structures to facilitate data sharing between entities without compromising on privacy.
- All stakeholders - the industry, academia, policy makers and the wider public could immensely benefit from big-data.
