

Climate Change and World Heritage Sites

Why in news?

\n\n

A recent study reveals that the World Heritage sites were threatened by climate change.

\n\n

What are the highlights?

\n\n

\n

- The study assesses the risk due to sea level rise by the end of the century at 49 UNESCO coastal Heritage sites.

\n

- It presents a risk index that ranks the sites according to the threat they face from today until the end of the century.

\n

- The sites featuring highest on this index in current conditions include Venice and its Lagoon, Ferrara, City of the Renaissance, and its Po Delta and the Patriarchal Basilica of Aquileia.

\n

- All these sites are located along the northern Adriatic Sea in Italy where extreme sea levels are the highest.

\n

- This is because high storm surges coincide with high regional sea-level rises here.

\n

- Dozens of UNESCO World Heritage sites in the Mediterranean are under severe threat of coastal erosion and flooding.

\n

- By the next century flood risk may increase by 50% and erosion risk by 13% across the region.

\n

\n\n

What are the challenges?

\n\n

\n

- The Mediterranean region has a high concentration of UNESCO World Heritage Sites.
- Many of these are in coastal locations as human activity has historically concentrated around these areas.
- The steep landscape and small tidal range in the area has meant settlements often located close to the waterfront.
- So rising sea levels pose a threat to these sites and settlements.
- But more information on the risk at a local level is needed.
- Also, the approaches to adaption and protection vary across the region due to large social and economic differences.
- Besides, Heritage sites face many challenges to adapt to the effects of sea-level rise as it changes the value and 'spirit of place' for each site.

\n

\n\n

What lies ahead?

\n\n

\n

- Further monitoring is required to better understand the effects of climate change on heritage sites and other natural hazards.
- The study has identified areas with urgent need for adaptation planning.
- The iconic nature of such sites can be used to promote awareness of the need to take action to mitigate climate change.
- In some cases, relocation of individual monuments may be technically possible too.
