

Cross-border Environmentalism

What is the issue?

\n\n

\n

- Emerging environmental concerns make cross-border environmentalism crucial for South Asia.

\n

- It is high time that India recognises this and takes the lead.

\n

\n\n

What is the emerging threat?

\n\n

\n

- Climate change is introducing massive disturbances to South Asia.

\n

- This is most notably from the rise of sea levels.

\n

- The entire Indian Ocean coastline will be affected.

\n

- But the hardest hit will be the densely populated deltas.

\n

- They include places where the Indus, Irrawaddy and Ganga-Brahmaputra meet the sea.

\n

- The distress is paramount in the northern half of the Indian subcontinent.

\n

- It covers areas from the Brahmaputra basin to the Indus-Ganga plain.

\n

\n\n

What are the environmental concerns?

\n\n

\n

- **Water** - The subcontinent is running out of water resource.

\n

- This is due to the demands of industrialisation and urbanisation.
\n
- It is also due to continuation of colonial model of irrigation based on flooding the fields.
\n
- **Rivers** - The economic and demographic forces are arrayed against the rivers and their right-of-way.
\n
- E.g. Ganga (Uttarakhand), Teesta (Sikkim) have been converted into dry boulder tracts by 'cascades' of run-of-river hydroelectric schemes.
\n
- The tributaries of the Indus were 'done in' decades ago through water diversion.
\n
- **Natural drainage** - Everywhere, natural drainage is destroyed.
\n
- Highways and railway tracks are elevated above the flood line, and bunds encircling towns and cities.
\n
- Reduced flows and urban/industrial effluents have converted great rivers into sewers.
\n
- Rivers are made to carry hundreds of tonnes of plastics daily into the Bay of Bengal and the Arabian Sea.
\n
- **Climate refugees** - The climate change discourse has not evolved enough to address this.
\n
- Tens of millions of 'climate refugees' could en masse move inland.
\n
- They may be forced to cross national boundaries in the search for survival.
\n
- E.g. the Farakka Barrage affected the livelihoods in downstream Bangladesh, causing the flood of 'undocumented aliens' in India.
\n
- **Glaciers** - The retreat of the Himalayan glaciers is jeopardising the perennial nature of our rivers.
\n

\n\n

- The '**atmospheric brown cloud**' is said to be the reason for excessive melting of snows in the central Himalaya.
\n
- The icefalls of the Himalaya could soon transform into waterfalls.

\n

\n\n

What are the policy shortfalls?

\n\n

\n

- **Participation** - The subcontinental environmental realities demand civic participation.

\n

- But despite being a vast democracy, the Indian state neglects this factor.

\n

- Efforts at preserving the forests and landscapes are mostly taken up by the indigenous communities.

\n

- The urban middle class is not visible in environmentalism, other than in 'beautification projects'.

\n

- **Governance** - The Environment Ministry is invariably the least empowered in the major countries of South Asia.

\n

- It falls short of coordinating the ecological response.

\n

\n\n

Why is India's role crucial?

\n\n

\n

- Wildlife, disease vectors, aerosols and river flows do not respect national boundaries.

\n

- The environmental trends must be discussed at the regional inter-country level.

\n

- But South Asian societies are apart, when they should actually be joining hands on common ground.

\n

- India is the largest nation-state of the region, and the biggest polluter.

\n

- Also, its population is the most vulnerable.

\n

- Given these, India should take the lead role in cross border environmentalism.

\n\n

Quick Fact

\n\n

Atmospheric brown cloud

\n\n

\n

- This cloud is made up of 'black carbon' containing soot and smog.
- It is the result of stubble burning, wood fires, smokestacks and fossil fuel exhaust.
- Dust kicked up by winter agriculture, vehicles and wind are sources as well.
- This high altitude haze covers the Indo-Gangetic plains for much of the dry season.
- It penetrates deep into the high valleys.
- It rises up over the plains and some of it settles on Himalayan snow and ice.
- They absorb the heat and melt much faster.
