

## Dangers of Fragmenting Tiger Populations

### What is the issue?

\n\n

\n

- A recent study has estimated that the probability of tiger extinction due to unplanned development is over 50%.

\n

- This is mainly because of changes in future land use, increased fragmentation of its habitat and the inevitable loss in genetic diversity.

\n

\n\n

### What does the study say?

\n\n

\n

- The study has used genetic data to capture the effects of changing landscapes and increasing isolation of tiger population.

\n

- It highlighted the unplanned development would increase extinction probability to 56% and result in a 35% decrease in genetic variability.

\n

- Like other large carnivores, tigers require vast swathes of jungle to hunt and thrive, and are particularly vulnerable to habitat fragmentation.

\n

\n\n

### What are the challenges?

\n\n

\n

- **Mining** - Increase in mined area and built-up area can lead to “15 times higher extinction probability” in small and medium protected forests.

\n

- Notably, Mines and Minerals (Development and Regulation) Act was recently amended to expedited environmental clearances.

\n

- Significantly, areas of large scale coal mining in central India (MP, Maharashtra and Chattisgarh) lie adjacent to Tiger Reserves.  
\n
- **Roads** - A key threat to tiger populations is the increase in road traffic, which is estimated to grow at 13% per annum for the next two decades.  
\n
- The busy Mumbai-Kolkata NH-6 cuts through the Nagzira Tiger Reserve and Nawegaon National Park in Maharashtra and its widening has been proposed.  
\n
- There has already been an increase in agricultural activities and construction along the highway, making it harder for tigers to move across.  
\n

\n\n

### **What can be done?**

\n\n

- **Restoring and protecting corridors** could reverse declining population.  
\n
- **Adding a buffer zone** around small populations was found to reduce the extinction probability by as much as 70%.  
\n
- There is already a lot of research on road ecology in the west and India needs to dig into them to evolve suitable solutions for tiger conservation.  
\n
- Notably, the study has suggested the **installation of mitigation structures** like under- and over-passes for wildlife to pass across roads.
