

## Dealing with Surplus Scenario - II

Click [here](#) for Part I

\n\n

### What is the issue?

\n\n

Markets should develop capacity to absorb higher milk and foodgrain output.

\n\n

### What are the recent developments?

\n\n

\n

- Falling producer prices of food crops and milk have emerged as a major issue over the last year.

\n

- The Centre has awarded increases in support prices (e.g. MSP) in the case of cereals and pulses.

\n

- The Maharashtra government has accepted the protesting dairy growers' demand to buy milk at Rs.25 a litre.

\n

\n\n

### What is the concern?

\n\n

\n

- **Procurement** - Higher support prices sometimes lead to negative outcomes.

\n

- This is especially true if they are not backed up by procurement and additional demand.

\n

- Evidently, the total pulses procurement was over 4 million tonnes in 2017-18.

\n

- But this procurement amounted only to less than a fifth of pulses output.

\n

- So it could not arrest a fall in prices to well below the support price level.  
\n
- Contrastingly, wheat and paddy prices for farmers are encouraging.  
\n
- This is because, in this case, procurement accounts for a third of the output.  
\n
- **Approach** - Falling producer prices is often mistaken to be a case of excess production.  
\n
- However, this could not be relevant in all cases as malnutrition is still rampant in India.  
\n
- Evidently, the net per capita daily availability of foodgrains (including cereals and pulses) has only now crossed the 500-gm mark.  
\n
- For milk, the per capita daily availability of over 350 gm is just a little more than the dietary recommendation.  
\n

\n\n

- **Inequality** - Clearly, there are inequalities in food intake across income groups.  
\n
- This is particularly true in the case of vegetables, fruit, milk and eggs.  
\n
- So it is clear that the population can absorb a higher output of food, eggs and milk.  
\n
- The real issue is thus of sorting out market limitations through a range of steps.  
\n

\n\n

## What could be done?

\n\n

- The procurement and public distribution system need to be strengthened and streamlined.  
\n
- An efficient PDS -  
\n

\n\n

- \n
- i. opens up additional demand
  - \n
  - ii. addresses nutritional deficiencies
  - \n
  - iii. helps stabilise the market by utilising a part of the produce
  - \n

\n\n

- \n
- Public kitchens, which have begun in the southern States, should be promoted elsewhere.
  - \n
  - States can introduce milk and its products in mid-day meals and in railway stations at cheap rates.
  - \n

\n\n

- \n
- In all, Indian agriculture needs a distribution system that can cope with much higher levels of output.
