

Demographic Dividends - Opportunities and Challenges

What is the issue?

 $n\n$

\n

- By 2020, it is estimated that the average age in India will be just 29.
- The dependency ratio will be as low as 0.4.
- While this demography provides an opportunity, there are multiple challenges that need to be addressed.

 $n\n$

What is the labour force scenario?

 $n\n$

\n

- 12 million young people enter the labour force each year.
- Millions transfer out of low productivity agricultural jobs to better paying alternatives.

۱n

- \bullet There is hence a need to create a large number of jobs to accommodate these people and drive productivity up. $\mbox{\sc h}$
- But even the most liberal estimates of employment generation do not suggest that the increase is commensurate with the requirement.
- Inability to deliver as many good jobs as required is partly responsible for India's labour participation rate falling to around 50%.
- Labour force participation is the ratio of working age population that is employed to that of those not employed.
- India has one of the lowest labour force participations (world average is 63).
- \bullet Women have been dropping out of the labour force in large numbers. $\ensuremath{\backslash n}$

What are some positive trends?

 $n\n$

\n

 \bullet Despite the overall low job creation, allocation of labour is improving in areas where it is difficult to measure it, i.e the informal sector. \n

 $n\n$

\n

- The informal sector combines services of old and new types.
- Sometimes the old type gets converted into new internet based businesses.
- Business is also migrating to where labour is rural.
- Rapid growth in rural non-agricultural employment is a promising prospect for enhancing incomes.

۱n

- Notably, 70% of India's workforce is rural based.
- But agriculture labour now accounts for only around 64% of rural employment.

۱n

• Unfortunately, as skill shortage is a big hindrance and skill sets needs to be enhanced by training programs.

\n

- India is also urbanising rapidly and the rapid growth in "census towns" again suggests a rapid pace of non-rural employment growth.
- \bullet Steps to increase productive employment is essential for social cohesion, sustainable growth, and to constructively harness the country's youthfulness. \n

 $n\n$

What are the ways for enhancing productivity?

 $n\$

\n

- **Short term measures** Addressing skills shortages, and ensuring flexible adaptability to industry requirements for the immediate needs.
- Three-month training can equip first-generation literate rural school-leavers

with skills for working in retail malls and related services.

- \bullet Also, similar three-month nano degrees can also re-train and equip industry workers with new skills that enhance their adaptability. \n
- Ensuring timely delivery of completion, certificated to the concerned workers is key to this initiative.
- This is mainly because, coordinating with multiple private agencies that are involved in the skilling programmes is proving difficult.
- \bullet There are also other issues to be addressed like lack of common standards, which is making in-house training in one industry irrelevant in another. \n
- **Medium term** Employment elasticity in Indian manufacturing sector is estimated to be only 0.09, as compared to a world average of 0.3. \n
- This points to the need for encouraging relatively low-skill labour-intensive industries like textiles, chemicals and food processing.
- \bullet Construction already has high employment elasticity of 0.19 and hence stimulus to low income housing is needed to improve job creation. \n

 $n\n$

\n

- The service industry will continue to be a major employer.
- Health and education services are currently severely under-provided.
- While their expansion at all levels will generate a lot of jobs, there is a dire
 need for capability enhancement of the workforce to fit the sector.

- The Indian Medical Council that creates entry barriers and chokes the expansion in the supply of doctors and nurses needs to be reformed.
- New teaching facilities should be judged on the basis of accreditation, and outcomes and structures for the same need to be strengthened.

 $n\n$

\n

- **Long-term measures** The quality of primary education needs to improve.
- This requires government schools to be freed from state control, and allowed

to compete and innovate in response to community needs.

- \bullet It is feared that automation will destroy jobs (especially low-skill ones), and the role of robotic is slated to increase drastically in manufacturing. \n
- Even in the services sector, answering robots are already replacing workers in call centres and even IT sector is seeing some automation.
- But historically, although technological change makes some occupations obsolete, it also creates new jobs, and raises income levels.
- \bullet Hence, rising levels and quality of education are essential for seamlessly adapting to the new highly productive jobs of tomorrow. \n
