

Depreciation Pampered Exports

What is the issue?

 $n\n$

\n

- The rupee's relative depreciation gave India's exports a greater edge, but it is not proving sufficient enough due to structural challenges.
- \bullet A competitive currency is a good thing, but what matters much more is labour and capital productivity. \n

 $n\$

What has caused the current status of rupee?

 $n\n$

۱n

- Lately, currency markets are clearly seeing dollar gaining strength against most world currencies and Indian Rupee too has tumbled to 69 per dollar,
- Experts are of the view that Rupee will depreciate further due to the prevalent macro-economic conditions in India.
- Notably, there has been a slowing in both FDI and FII inflows and India's software earnings and remittances from abroad have also faltered.
- Significantly, software earnings which grew by around 24% per year in FY02-12 and has crashed to a mere 2.9% presently.
- Remittance growth slowed from over 16% to a mere 0.1% during the same time frame – majorly due to the unrest in the Middle-East.

 $n\n$

What are the likely implications?

 $n\n$

\n

- Weakening rupee will push up crude import bills and consequently inflation and the recent MSP increases will also accentuate this.
- \bullet The traditional view is that depreciating currency will boost export competitiveness and set in a demand for Indian produce. \n
- But significantly, most other competing currencies (like Vietnam's) are also weakening currently, thereby muting the currency advantage.
- In fact, data shows that India's exports are actually doing quite poorly overall despite a slight pickup in FY18 (after the massive slump in FY16).
- Notably, from \$315 billion in FY14, exports fell to \$262 billion in FY16 and then recovered to \$303 billion in FY18. $\$

 $n\n$

Why aren't exports increasing?

 $n\n$

\n

- Increased exports are not just about the value of the currency, but are also heavily determined by factors like quality and productivity.
- Trends in the textile sector indicate this, with India's share of exports to U.S. growing just 1% between FY 12-18 from 6.5% to 7.5%.
- While Vietnam's share in the U.S. imports grew by over 5%, from 7% to 12% during the same period.
- Significantly, during the aforementioned years, Vietnam's Dong depreciated just about 10% while Indian Rupee fell around 30%. $\$

 $n\$

What is the way ahead?

 $n\n$

\n

- Currently, as exports are slacking despite the currency advantage, net trade deficit is actually worsening due to depreciation.
- \bullet More importantly, recent MSP hikes will also hinder agricultural exports. $\ensuremath{\backslash} n$

- If the government is keen to give a push to India's exports, it will have to do a lot more to increase productivity levels.
- \bullet This requires changes in labour laws or the removal of infrastructural and other bottlenecks like comparatively high electricity tariffs in India. \n
