

Earthquakes

Why in News?

Recently the National Capital Region, Delhi and adjoining regions faces a shallow earthquake of 4.0 magnitude with a focal depth of five kilometres.

- An earthquake is a phenomenon that occurs without warning and involves **violent shaking of the ground** and everything over it.
- It results from the release of accumulated stress of the moving lithospheric or crustal plates.
- An earthquake is the sudden movement of Earth's crust at a fault line.
- It is also called as quakes, tremors, or temblors.
- **Epicenter** - The location where an earthquake begins is called the epicenter. An earthquake's most intense shaking is often felt near the epicenter.
- However, the vibrations from an earthquake can still be felt and detected hundreds, or even thousands of miles away from the epicenter.
- The energy from an earthquake travels through Earth in vibrations called seismic waves, measured by seismometer.
- **Types of energy**

P waves or primary waves	<ul style="list-style-type: none"> • These are the first waves to be detected. • These are compressional waves that push and pull as they move through rock and fluids.
S waves or secondary waves	<ul style="list-style-type: none"> • These are the second waves to be detected. • These waves move <u>only through rock</u>. • They move up and down or side to side, perpendicular to the direction in which the wave is moving.
Surface waves	<ul style="list-style-type: none"> • It follows P and S waves. • They travel along the surface of the earth and thus cause the most damage. • Surface waves can be characterized as Love waves, which are faster and move the ground from side to side.

- **Types Of Earthquake** - Along with the tectonic earthquakes, there are also 3 types of earthquakes.
 - **Volcanic** - Earthquakes that occur in conjunction with volcanic activity
 - **Collapse** - Smaller-scale earthquakes that result from the subterranean collapse of caverns or mines
 - **Explosion** - Earthquakes caused by underground explosions of nuclear or chemical devices.
- **Depth**
 - **Shallow earthquakes** - 0 to 70 km deep
 - **Intermediate earthquakes** - 70 to 300 km deep.

- **Deep earthquakes** - 300 to 700 km deep.
- **Scenario in Delhi** - Delhi lies in the ***Aravalli-Delhi Fold Belt***, a seismically-active geological belt extending from southern and eastern Rajasthan to Haryana and Delhi.
- Over the years, the tectonic activity in the region has slowed down considerably, leading to greater geological stability. But some faults still remain, which give rise to occasional mild earthquakes.
- **Medvedev-Sponheuer-Karnik scale** - It is a ***measure of intensity***, rather than strength, or energy released, which is described by magnitude.
- Delhi is classified in ***Zone 4***, the 2nd highest classification of areas based on their susceptibility to shaking experienced during an earthquake.
