

Ecological Impact of Coal Transportation - Goa

What is the issue?

 $n\n$

\n

• Ideas for reducing the ecological footprint of coal are majorly focused at the mines level.

\n

Pollution caused by the transport of coal hasn't got the deserved attention.

 $n\n$

What is Goa's case?

 $n\n$

\n

• Coal is mainly imported into India at Marmugoa port (Goa) from Australia, Indonesia and South Africa.

۱n

 Goa Pollution Control Board's 2015-16 report, states that the PM10 reading of Mormugao port exceeded permissible limits.

• Official records also show that coal in excess of permissible limits is being handled at the Mormugao port.

\n

• This coal is mainly used up in steel plants of Karnataka and transport happens by road or rail.

\n

• 34,200 tonnes of coal is transported each day through the rail route from the Marmugoa to various destinations in Karnataka.

\n

• The nearly 400-km journey of this fossil fuel has been found to have profound ecological impacts and is risking habitations.

\n

 \bullet Coal dust has also pushed up incidents of respiratory disorder and is threatening fragile forests, paddy fields, streams and rivers. \n

What is the way ahead?

 $n\$

\n

- There have been various regulatory lapses and violations in coal imports at Marmagoa Port, which needs to be addressed.
- \bullet This acquires greater urgency given that Mormugao port plans to more than double its coal imports by 2030. $\$
- Environmental audits have blamed the transport of coal for the high pollution levels in coal-rich Jharkhand and Maharastra too.
- Although government has been emphasising on renewable coal is expected to hold primacy for the foreseeable future (60% by 2022).
- \bullet It is hence imperative to evolve a comprehensive policy to ensure that coal is transported in environmentally sensitive ways. \n
