

## **Economic Impact of Climate Change**

### **Why in news?**

\n\n

In an analytical chapter released ahead of the World Economic Outlook, IMF has highlighted the damaging macroeconomic impact of weather shocks.

\n\n

### **What are the highlights?**

\n\n

\n

- It emphasizes that adverse weather events are particularly very impactful for the low-income countries.

\n

- 1 °C increase from a temperature of 22degree Celsius reduces the growth of median emerging market economy by 0.9% in a year.

\n

- Its impact on the median low-income developing country is even higher.

\n

- The growth doesn't recover quickly after a weather shock and takes evens decade to fully recover.

\n

- Countries located in areas with higher temperature are highly vulnerable to the impact of global warming.

\n

- The resultant loss of output and lower productivity also affects capital formation.

\n

- The overall impact is a considerable bearing on the medium- to long-term growth prospects of the country.

\n

\n\n

### **What makes India more vulnerable?**

\n\n

\n

- India, being a **tropical country**, is more susceptible to changes in temperature.  
\n
- Also, in India, about 50% of the population directly or indirectly depends on **agriculture** for a livelihood.  
\n
- The existent distress in the farm sector and the state governments' response with loan waivers have already strained their **fiscal condition**.  
\n
- Furthermore, the production of kharif crops is expected to decline.  
\n
- The possibility of adverse weather events is likely to increase in the future posing a greater challenge.  
\n
- The impact of climate change in agriculture is thus expected to reverberate in other sectors of the economy and affect the overall growth prospects.  
\n

\n\n

## **What should be done?**

\n\n

- **India-** India, which is considerably better, still has to strengthen its **macroeconomic stability** to deal with temperature shocks.  
\n
- India has considerably reduced its dependence on the monsoon as evident from avoiding a runaway inflation even after two successive years of drought.  
\n
- However, more needs to be done to enhance **productivity** in the agriculture sector.  
\n
- India can work on **programmes** that will help improve the quality of land and reduce the risk of climate change. Ex: Use employment under the MGNREGA to enhance soil and water conservation.  
\n
- India also needs to strengthen its overall capability by investing in and adopting new **technology**.  
\n
- **Global** - Emerging market and low-income economies will have to build significant macroeconomic resilience so as to reduce the impact.  
\n
- Right policies and institutions in place may help attenuate the effects of

temperature shocks, to some extent.

\n

- In all, it is essential for the countries to realize that steps to minimize the impact of climate change will have to be taken both at individual country and global levels.
