

## **Formalin: A Banned Preservative**

#### What is the issue?

 $n\n$ 

\n

- Fish laced with formalin has flooded the markets across states.
- $\bullet$  This is creating a massive health scare and the Goa government has recently banned fish supplies from other states temporarily. \n

 $n\n$ 

## Why did Goa ban fish from other states?

 $n\n$ 

\n

- Due to fears of alleged formalin contamination, officials of the Food and Drug Administration (FDA) inspected fish markets in Goa.
- They picked up various fish samples from various states for testing and had confirmed traces of formalin, which is a banned preservative.
- The episode caused a scare, which prompted the Goa government to announce a 15 day ban on entry of fish from other states.
- $\bullet$  Border checks have also been established to inspect trucks for fish.  $\mbox{\ensuremath{\mbox{\sc h}}}$

#### What is formalin?

 $n\n$ 

۱n

- Formalin is a form of hydrated formaldehyde, which is used as a preservative in museums to ensure the specimens doesn't decompose.
- $\bullet$  It is also used to harden human tissue for post mortem examinations.  $\ensuremath{\backslash} n$

- It can cause gastric irritation and it also speculated to be carcinogenic, and thereby not fit for human consumption even in minimalistic proportions.
- Notably, even in laboratories, only diluted formalin is said to be used.
- Some amount of formalin is naturally formed while fish is transported with ice, but these are usually bound with tissues and not a risk.
- Contrastingly, if fish is laced externally with formalin (to prolong shelf-life), it remains free and can cause serious health issue.

 $n\n$ 

## Where else was formalin detected in fish?

 $n\n$ 

\n

- The first reports of formalin-laced fish came from Kerala, a state that consumes around 10,000 tonnes of fish every day.
- $\bullet$  Some consumers raised the issue that the fish didn't smell and didn't decompose even when placed outside the fridge for as long as two days. \n
- Subsequently, Kerala government has been carrying out a storm of raids under its fish safety and hygiene campaign "Operation Sagar Rani".
- Inspections led to the seizure of about 9,600 kg of contaminated fish in Kollam district and about 6,000 Kg of fish in Palakkad district.
- Notably, Tamil Nadu officials have also been carrying out raids for the last two weeks, but laboratory tests have so far returned negative for formalin.

 $n\n$ 

# Where is the formalin contamination originating from?

 $n\n$ 

\n

- Andhra Pradesh has around 4,000 hectares of aqua-culture farms, whose output peaks during the monsoon season (when coastal fishing is banned).
- $\bullet$  To meet the market demand, cultured fish from Andhra is to be transported widely, with sufficient quantity of ice for retarding degradation. \n

• But as distances are large, the fish nonetheless tends to get spoilt in transport.

۱n

- $\bullet$  This has led Andhra fish suppliers to lace fish with formalin, which retards degradation to more than 10 times its natural rate. \n
- Notably, even a state as far as Assam found that formalin laced fish from Andhra was reaching its market (Assam has also banned outside fish now).
- Also, Data from across the southern states indicates that it is the fish sourced from Andhra that is the most likely to be contaminated with formalin.

 $n\n$ 

### What is the way ahead?

 $n\n$ 

\n

- **Technology** Kochi-based "Central Institute of Fisheries Technology" (CIFT) had earlier developed a detection kit for easy detection of formalin.
- This has proven really effective presently and is being widely used now.
- Inspections Regular inspections, testing and seizures form the markets would help in reducing this malpractice.
- Some states have sent official communication to Andhra Pradesh regarding the same, and which now needs to crackdown on unscrupulous suppliers.

 $n\n$ 

\n

- Infrastructure The most common reason for "dishonest traders" using formalin is the unavailability of good quality ice at harvest centres.
- $\bullet$  Inadequate insulation during domestic transport and lack of warehousing facility for bulk storage of fish are also additional reasons for formalin lacing. \n
