

Inclusive Healthcare

What is the issue?

 $n\n$

With increasing emphasis on technology in healthcare, it is essential to ensure that it does not leave out the most in real want of it.

 $n\n$

What is the need?

 $n\n$

\n

• The need for a healthy relationship between technology and medicine is vital in today's world.

۱n

• This relationship is determined by the interaction between tech companies and the medical profession.

۱n

- The entry of technology is believed to close the gap of relative lack of medical professionals to cover India's large population.
- The logic is that e-health and phone advice could address this lacuna.
- \bullet But on deeper reflection, this view seems to be flawed, given the nature of functioning of the healthcare system in India. \n

What are the concerns in India?

 $n\$

\n

- The number of medical professionals for the able-to-pay populace (as against the total population) is far too many (more than in developed nations).
- So the majority of Indians, who cannot pay, are unable to access the level of medical care available to the favoured few.

- Tech companies, being corporate bodies and profit-seeking, are driven to focus on the patients who can pay.
- \bullet Notably, this section is the same favoured few served by medical professionals. $\ensuremath{\backslash n}$
- \bullet The fact that they want to serve the unattended many is hence suppressed. $\ensuremath{\backslash n}$
- \bullet There is lack of effort to elevate the earning capacity, improve the health standards of the people and improve the quality of public hospitals. \n
- \bullet So the aim of technology should be to help the underserved receive the same quality of care available to the fortunate few. $\mbox{\sc h}$
- \bullet It should complement and improve the ability of professionals to do their assigned tasks. $\ensuremath{\backslash n}$
