

Multiple frontiers of Agrarian Distress

Why in news?

\n\n

\n

- Recently, 184 farmer groups from across states congregated at Delhi to stage a protest walk to highlight their distress.

\n

- The issue is multi-dimensional and needs a studied and structural approach.

\n

\n\n

How is the trend in the farm sector?

\n\n

\n

- The agriculture sector is characterised by instability in incomes because of various types of risks involved in production, market and prices.

\n

- “National Commission of Farmers – 2006”, chaired by noted scientist M.S.Swaminathan, had also pointed out some serious stress points in the sector through its reports.

\n

- The agriculture growth rates have been unsteady in the recent past, at 1.5% in 2012-13, to 5.6% in 2013-14 and (-) 0.2% in 2014-15.

\n

- These trends reflect the extent of distress and 2017 was also marked by several farmer protests nationwide, with a few turning violent.

\n

\n\n

What has precipitated this crisis?

\n\n

\n

- **Small Land Holding** - Rising population pressure on land, is central to this crisis, with small and marginal farmers (less than 2 hectares) accounting for 72% of land holdings.

\n

- The average farm size in India is small, at 1.15 hectare, and since 1970-71, there has been a steady declining trend in land holdings.

\n

- This predominance of small operational holdings is a major limitation to reaping the benefits of economies of scale.

\n

- Since small and marginal farmers have little marketable surplus, they are left with low bargaining power and no say over prices.

\n

\n\n

\n

- **Nature's challenge** - Crop production is always at risk because of pests, diseases and shortage of inputs like seeds, which could result in low yield.

\n

- Low irrigation coverage, drought, flooding and unseasonal rains and incompetent government relief operations are some other irritant factors.

\n

- **Market Dynamics** - The lower than remunerative price in the absence of marketing infrastructure and profiteering by middlemen only adds to the financial distress of farmers.

\n

- Inconsistent and uncertain policy regulations such as "Agricultural Produce Market Committee (APMC Act)" have only exacerbated the problems.

\n

\n\n

\n

- Fluctuations in demand and supply owing to 'bumper or poor harvest' and 'speculation and hoarding' by traders significantly damage farmer prospects.

\n

- This is because of their low resilience due to the perishable nature of goods, inability to hold or hedge in surplus-shortage scenarios.

\n

- **Credit Access** - Vicious informal credit through moneylenders, and lack of short term and long term formal loans have resulted in chronic indebtedness.

\n

- Crop insurance against losses has also not yet comprehensively taken root.

\n

\n\n

What is the way ahead?

\n\n

\n

- Currently, farmers have been highlighting the demands for “remunerative price and freedom from debt” through several platforms.

\n

- These are seen as a safety cushion in their fight against risks of weather and disaster, price, credit, erratic market dynamics and policy uncertainty.

\n

- While growth in agriculture has slowed down, the costs of farm inputs have increased faster than farm produce prices.

\n

- As the cost of capital too has increased manifold over the years, agriculture has become largely an unprofitable venture.

\n

- To increase and ensure stable flow of income to farmers it is vital to manage and reduce the economic risks by analysing, categorising and addressing them.
