

# NASA's Report on Hydrological Change

### Why in news?

 $n\n$ 

NASA satellite observations of Earth has found that there is a serious decline in the availability of freshwater in India.

 $n\n$ 

#### What are the findings of the study?

 $n\n$ 

\n

• NASA used data on human activities to map locations where freshwater is changing around the globe.

۱n

- $\bullet$  This is the first time that observations from multiple satellites in a thorough assessment of how freshwater availability is changing everywhere on Earth.  $\$
- $\bullet$  In some regions water supplies were found to be relatively stable, others experienced increases or decreases.  $\mbox{\sc h}$
- $\bullet$  The study found that Earth's wet land areas are getting wetter and dry areas are getting drier due to a variety of factors.  $\mbox{\sc h}$

 $n\n$ 

#### What is the reason behind this decline of fresh water?

 $n\n$ 

\n

- $\bullet$  The factors for this phenomenon includes human water management, climate change and natural cycles.  $\ensuremath{\backslash n}$
- Distinctive pattern of the wet land areas of the world getting wetter those are the high latitudes and the tropics and the dry areas in between getting dryer.

\n

• Pumping groundwater for agricultural uses is a significant contributor to

freshwater depletion throughout the world.

 $\bullet$  Groundwater levels are also sensitive to cycles of persistent drought or rainy conditions

 $n\n$ 

## What are the implications for India?

 $n\n$ 

\n

\n

- Areas in northern and eastern Indiaare among the hotspots where overuse of water resources has caused a serious decline in the availability of freshwater that is already causing problems.
- In northern India, groundwater extraction for irrigation of crops such as wheat and rice have caused a rapid decline in available water, despite rainfall being normal throughout the period studied.
- $\bullet$  The extractions in these parts has already exceed recharge during normal precipitation and does not bode well for the availability of groundwater during future droughts. \n
