

## Official Land Holding of the Government

### What is the issue?

\n\n

\n

- The Centre does not know exactly how much property it owns.
- \n
- This has created various problems with the economy and the land use pattern of the urban areas.
- \n

\n\n

### What is the official status?

\n\n

\n

- The information provided by the Government Land Information System (GLIS) is incomplete.
- \n
- Various Central Ministries admit to owning only about 13,50,500 hectares of land.
- \n
- But disparate official sources suggest that the correct figure is several times more.
- \n
- Also a large proportion of government land lies unused.
- \n
- The Ministries of Railways and Defence, respectively, have 43,000 hectares and 32,780 hectares of land lying vacant.
- \n
- According to reports of the CAG, the 13 major port trusts have 14,728 hectares of land lying idle.
- \n

\n\n

\n\n

\n\n

	Total Land holding claimed in the GLIS	Total Land Holding#	Surplus Land#	Encroached area#
Railways	2,92,960	4,23,000	43,000	2,240
Defence	38,362	7,11,032.67	32,780	4,856.23
Port Trusts (13 Major)		31,238.15	14,566.83	161.18
Airport Authority of India (AAI)		55,037.25		422.82

\n\n

### What is the problem of unused land?

\n\n

\n

- **High Value** - A large part of the unused land is high-value property in prime areas in major cities.
- Land hoarding by government agencies has created artificial scarcity.
- It is one of the main reasons for skyrocketing urban real estate prices.
- Middle and lower-income households find adequate housing unaffordable.
- High land prices also reduce competitiveness by increasing the cost of industrial and development projects.
- The allocation of unused land is rife with corruption.

\n

\n\n

\n

- **Urban planning** - To maintain efficiency amidst increasing population and economic growth, the Floor space index (FSI) should also increase.

\n

- However, most Indian cities defy these basic tenets of urban planning due to the large areas of unused or underutilised government land with an irresponsibly low FSI.

\n

- The FSI in Shanghai is four times of that of Delhi and Mumbai.

\n

- **Economic growth** - Solving the problem of wastage could generate employment and pull masses out of poverty.

\n

- Another report by the CAG on SEZs shows that 53% of the total land acquired by the government for these zones remains unused.

\n

\n\n

## What should be done?

\n\n

\n

- The need of the hour is a comprehensive inventory of land resources and usage patterns for all government branches.

\n

- It should include information on the location of each property, its dimensions, the legal title, current and planned use, and any applicable land use restrictions.

\n

- The government should also agree to disclose its land use and release of excess land, the use of which it cannot justify.

\n

\n\n

## Quick Facts

\n\n

## Floor space index (FSI)

\n\n

\n

- Floor space index (FSI) is the total floor area built per square metre of land.

\n

- If a single-storey building occupies 50% of a plot, the FSI would be 1/2.

\n

- If the building is expanded vertically to have four stories, the FSI will go up

to two (4 times  $1/2$ ), as the effective floor area has quadrupled.
