'Junior Heritage Mistri' programme

\n\n

\n

- The scheme comes under the **Centre's Heritage Mason programme**. Rajasthan was chosen as a pilot State for the scheme in view of its rich architectural heritage.

\n

- Rajasthan government is raising a new class of masons to help conserve the State's rich architectural heritage.

\n

- Under the programme, the government has started training youths on indigenous building practices, arts and crafts, traditional structures and knowledge systems, with an emphasis on preservation of heritage architecture.

\n

- The institution promotes construction practices based on adaptive reuse of traditional technology blended with modern techniques.

\n

\n\n

Stereolithography

\n\n

\n

- Scientists have developed a novel way to 3D-print objects using glass.

\n

- Researchers mixed nanoparticles of high-purity quartz glass and a small quantity of liquid polymer and allowed the mixture to be cured by light at specific points — by means of stereolithography.

\n

- Stereolithography is a form of 3D-printing technology used for creating models, prototypes, patterns and production parts in a layer by layer fashion using **photopolymerisation**.

\n

- Photopolymerisation is a process by which light causes chains of molecules to link, forming polymers.

- \n
- A variety of 3D-printing techniques available so far have been used on polymers or metals, but rarely on glass.
- \n
- Scientists have developed a new method to 3D-print objects using glass, an advance that could be used to make **very small optical components for complex computers**.
- \n
- The 3D-printed glass can be used for many applications, including data technology.

Vitamin C

\n\n

- \n
- During times of stress or hostile conditions, such as increased temperature and presence of antibiotics, bacteria tend to come together and form a **biofilm** to protect themselves.
- \n
- The stress response pathway is crucial for bacteria to survive during hostile conditions. So blocking this pathway is a sure way of killing the bacteria.
- \n
- New study at IISc has found the molecular mechanism by which vitamin C impedes the formation of biofilm and even kills **Mycobacterium smegmatis**, a non-pathogenic bacterium that belongs to the same genus as the TB-causing mycobacteria.
- \n
- **Other uses of Vitamin C:** Boosts and strengthens immunity. It speeds-up recovery from tuberculosis and impedes the TB causing bacteria from causing disease, and even kill the bacteria in culture at high concentration.

Biological sensors

\n\n

- \n
- Migratory birds have biological sensors that can sense the earth's magnetic field, and guide them in their long journeys spanning continents.
- \n
- One might, mistakenly assume that these sensors would be located in the

brain. Contrarily, they are located in the eyes, **more specifically, in the right eye.**

\n

- Birds' biological compass is due to the **interplay of chemical reactions, electron spins and the magnetic fields** present.

\n

- Thus, understanding the avian compass is a lesson in quantum biology. This may be of use, one day, in engineering quantum computers.
