Zinc supplements

\n\n

\n

- Recently researchers found that Zinc supplements may halt the rapid growth of oesophageal cancer cells.
- Zinc selectively halts the growth of cancer cells but not normal oesophageal epithelial cells
- Zinc is an important element in many proteins and many enzymes and its absence makes it impossible for cells to function.
- An insufficient amount of zinc can lead to the development of cancers and other diseases.

\n

\n\n

Oesophageal cancer

\n\n

\n

- It is a Cancer of the tube that runs from the throat to the stomach, which affects people who are more than 40 years of age.
- Smoking and poorly controlled acid reflux are significant risk factors for oesophageal cancer.
- Treatment focuses on removing the cancer through surgery.
- Chemotherapy and radiation may also be used.

\n

\n\n

Parkinson's drug

\n\n

- There is a low incidence of many cancers (with the exception of melanoma) in patients with Parkinson's disease.
- This is due to Carbidopa a Parkinson's disease drug, displays significant anticancer effects in human cell when given at normal patient dosage levels.

Parkinson's disease

- It is a disorder of the central nervous system that affects movement, often including tremors.

- Dopamine is a chemical that sends behavioural signals from the brain to the body.
- Nerve cell damage in the brain causes dopamine levels to drop, leading to the symptoms of Parkinson's

- Parkinson's often starts with a tremor in one hand, other symptoms are slow movement, stiffness and loss of balance.
- Medication can help control the symptoms of Parkinson's.
- It affects the age group from 6 to 60, treatment can help but this condition can't be cured.

Congenital Cardiomyopathies

- Recently researches found ways to preserve heart function after heart attacks or for people with inherited heart defects known as congenital

cardiomyopathies.

\n

- They have stopped or slowed cardiac fibrosis (thickening of heart valves) organ enlargement and preserved heart function by blocking a well-known molecular pathway.
- The Wnt/ β -catenin signalling pathway is involved in several of the body's fundamental biological processes.
- After heart attack, Wnt/ β -catenin signalling ramps up in cardiac fibroblast cells to cause fibrosis, scarring and harmful enlargement of the heart muscle.
- This condition makes it hard for the heart to deliver blood to the body, and can lead to heart failure.

\n\n

Perovskite solar cells

\n\n

\n

- A Perovskite structure solar cell is one that includes a compound which can build solar cells that are inexpensive and highly efficient.
- Perovskite is a material that has the same crystal structure as the mineral calcium titanium oxide.
- Due to their unique crystal make-up, they often display a number of interesting properties, including superconductivity, giant magneto resistance, and Ferro electricity.
- Within the last several years, perovskite solar cells have outpaced all other third-generation solar technologies in terms of efficiency.
