

Preserving Geological Heritage

What is the issue?

 $n\n$

\n

- Billions of years old geological features are being vandalised in many areas in the country in the name of developmental activities.
- \bullet Efforts need to be taken to safeguard our geological structures. $\ensuremath{^{\backslash n}}$

 $n\n$

What is the significance of geological structures?

 $n\n$

\n

- India's tumultuous geological past is recorded in its rocks and landscapes.
- \bullet They should be considered as our non-cultural heritage. $\ensuremath{^{\backslash n}}$
- \bullet The eological impacts of the distruction of geological sites are also a major concern in this era of rapidly changing climate patterns. \n

 $n\n$

How vulnerable are these structures?

 $n\n$

۱n

- \bullet Land sections containing fossils & geo-faults are lost forever due to construction of highways and real estate development. \n
- India accounts for more than 30% of stone production in the world. $\ensuremath{^{\backslash n}}$
- \bullet This industry has been unscientifically mined and managed. $\ensuremath{\backslash n}$
- It is generally outside the pale of public scrutiny, and remains unregulated.

\n

- Along with weak environmental laws governing it, India's topography and geological heritage stand to be lost forever.
- The Geological Survey of India is the agency entrusted with the protection of geological features.

\n

- More than 26 sites have been selected for targeted preservation.
- But not much has changed on the ground.

 $n\n$

What should be done?

 $n\$

\n

• A comprehensive inventory of geological structures in the country needs to be created by GSI.

\n

 $n\n$

\n

 A sustainable conservation approach for our natural geological heritage should be formulated as it has been done for biodiversity.

 $n\n$

\n

- Geological features that should be declared as national assets include bodies of unusual rock or mineral types, landforms holding records of natural events of the past & significant fossil localities.
- $\hbox{\bf \cdot} \hbox{\bf Geo-conservation should be made a major factor in land use planning.} \\ \verb|\n$
- \bullet Stringent legal framework needs to be evolved to support such conservation strategies. $\ensuremath{\backslash} n$
- \bullet Educational outreach programmes about these treasures need to be organised for officials, politicians and the public. $\ensuremath{\backslash n}$

 $n\n$

How to educate people?

 $n\n$

\n

- \bullet The collective memory reinforced through memorials & museums will make communities aware. $\ensuremath{^{\text{h}}}$
- Japanese initiative The Kobe earthquake memorial park in Japan preserves a section of the fault line (around 150m) which ruptured during the 1995 disaster through the town of Hokudan.
- \bullet We could emulate this Japnese model to preserve the memory of major geological events. $\mbox{\sc h}$
- On this line, the now-defunct Kolar gold mines could be developed into a geological museum with an educational outreach unit for students.
