

## Preventing designer babies

Click [here](#) to know on CRISPR

\n\n

### What is the issue?

\n\n

With the evolutionary technique entailing the editing of genes by bacterial DNA scissors called CRISPR, the debate on designer babies is set in motion.

\n\n

### What are the concerns to be addressed?

\n\n

\n

- **Beauty** - There is a possibility of using it to alter genes to make babies look more attractive, smarter, stronger, etc.

\n

- Confusion of “cure” with “cosmetics” need to be addressed.

\n

- The technique should be used solely for life-saving medical interventions, while the cosmetic baby design should be prevented.

\n

- **Safety** - Most drug regulatory regimes insist that drug makers submit clinical trial data to establish that their drugs are safe and effective.

\n

- The issue in this case is about the longevity of these trials as genetic changes and alterations take years to manifest.

\n

- An incremental case-by-case approach could be adopted.

\n

- **IP** - Governments must get it right while dealing with the corporate conglomerates, and their “trade secret” and other intellectual property (IP) issues.

\n

- We need to therefore encourage more **transparency and openness** and open up this gene trial data to the wider public, and to scientists and doctors.

\n

- Given all these concerns it is essential to establish firmly, certain **baseline principles** to go ahead with gene editing in all its fairness.
