

Qurater II - Earning Growth

What is the issue?

 $n\n$

\n

 \bullet There has been some earning recovery in the 2^{nd} quarter, but profitablilty has been low.

\n

 \bullet There is also no clear concensus on the growth estimates. $\ensuremath{\backslash n}$

 $n\n$

What are the statistics?

 $n\n$

\n

- \bullet The July-September 2017 earnings of India Inc were muted as companies struggled to adjust to the GST that rolled out on July 1. $\$
- While revenue growth was the second best in 3 years, profitability proved to be a major concern.

\n

- Combined net profit for 1,852 companies declined by 2.6% even as revenue grew by 8.7% year on.
- **Contributing Sectors** Notably, the financial and energy sectors propped up the overall numbers.
- \bullet Excluding them, the revenue growth was just 6.9% and net profits plummeted due to increasing raw material and employee costs. \n
- Large Firms A further disaggregation of the data reveals that large-cap companies did better than the small- and mid-sized ones. $\$
- A strong performance by companies in refining, finance, automobiles and metals has contributed to this.
- This is also an indication that large firms were also able to withstand

demonetisation and the GST better.

\n

- Also, the combined net profit of Nifty 50 companies was up 12.1% during this quarter (2 $^{\rm nd}$) as against a 0.3% decline in the 1 $^{\rm st}$ quarter.
- Notably, Nifty companies account for 80.1% of the net profits of the entire sample, up from 78.8% a year ago.

 $n\$

What were the positives?

 $n\n$

\n

- Bank slippages were lower during the second quarter of this financial year and non-performing assets did not rise much.
- **Restocking** Consumer businesses such as automobiles also recovered from the lows of the April quarter.

۱n

- \bullet This was due to distributors and dealers restocking after the implementation of the GST to target an early festive season. $\mbox{\sc h}$
- **Revised Estimates** The earnings season also saw analysts raising their consensus estimates of Nifty stocks to around 10% for 2017-18.
- This was a surprising change from the sharp cuts to consensus earnings every quarter in the recent past.
- \bullet Notably, the number of Nifty companies that missed their estimates fell to its lowest in the last three years. \n

What are the concerns?

 $n\n$

 $n\n$

\n

- The past 3 years have seen ambitious forecasts at the beginning of the year followed by sharp cuts as the year progressed.
- While some are projecting strong earning growth ahead, not all analysts agree.

\n

- Rather, an early Diwali, GST and a weak base is thought to be driving the trend rather than actual growth.
- \bullet Notably, some brokerages have already scaled down their earnings estimated by about 25-30% from the consensus estimate. \n
- \bullet While the upgrades in consensus earnings in the $2^{\rm nd}$ quarter have seen the stock market rally, the latest concerns leave the market vulnerable. \n
