

Reassessing AIDS Measures

What is the issue?

\n\n

Observing December 1 as the World AIDS day, it should be taken note that after 2011, the decline in new infections had not been very impressive.

\n\n

What are the global measures?

\n\n

\n

- Specific themes are chosen every year to drive home the messages of prevention, treatment and fighting stigma and discrimination associated with AIDS.

\n

- This year's theme is 'know your status' which signifies universal testing followed by treatment of those who are tested positive.

\n

- In the last 30 years, no other disease control programme has attracted such global attention as AIDS.

\n

- Other initiatives and measures include

\n

\n\n

\n

- i. a UN General Assembly Special Session (UNGASS) on AIDS in 2000
- ii. a UN Security Council resolution treating AIDS as a security issue
- iii. a special Global Fund to finance AIDS programme along with TB and Malaria (about \$20 billion for AIDS programmes alone)

\n

\n\n

\n

- But the real game changer was the strong involvement of civil society.

\n

- This especially included marginalised communities like sex workers, transgender population, gay men, people who use drugs and people living with HIV/AIDS.

\n

\n\n

How did these benefit?

\n\n

\n

- The cumulative effect was a greatly reduced mortality due to AIDS related illnesses.
- From a high of 1.5 million in 2000, it was reduced to 9,40,000 in 2017.
- The incidence of HIV, the new infections occurring every year, has also registered an impressive decrease.
- It has come down from 0.49 per thousand adults in 2000 to 0.33 in 2010.
- But instead of going forward and ensuring the reduction of new infections, the global programme lost direction around that time.

\n

\n\n

What happened thereafter?

\n\n

\n

- Both prevention of new infections and saving lives of infected people should be twin priorities.
- But the emphasis has decisively shifted to treatment alone.
- An entire spectrum of anti-retroviral drugs came into the market.
- Also, donors started investing in treatment programmes focussed on generalised epidemic countries in sub-Saharan Africa.
- UNAIDS has kept 90-90-90 as their top priority focussing on testing, treatment and viral suppression.
- [By 2020, diagnose 90% of all HIV-positive persons, provide antiretroviral therapy (ART) for 90% of those diagnosed, and achieve viral suppression for

\n

90% of those treated]

\n

- But somewhere in this process, the agenda of reduction of new infections among key populations lost the needed attention.
- \n
- More worryingly, the legal environment surrounding these populations has turned increasingly hostile.
- \n
- E.g. Same sex relations, transgender identity and sex work have all come under increasing pressure of criminalisation.
- \n
- But Global Commission on HIV and Law had emphasized that improving the legal environment alone could save up to 1 million new infections every year.
- \n
- Moreover, access to affordable prevention devices like condoms, needles and syringes greatly suffered in the last six to seven years.
- \n
- Funds for prevention programmes have dried up and the meagre amounts earmarked never reached the implementers.
- \n
- Several civil society organisations that were doing well lost momentum for want of adequate financial support.
- \n
- Resultantly, prevention interventions were left in the hands of inexperienced programme managers.
- \n

\n\n

What was the result?

\n\n

\n

- The rate of decrease of new infections started slowing down since 2011.
- \n
- It has virtually stayed still in the last three to four years.
- \n
- The cumulative decrease of new infections from 2010 to 2017 was just 18%, a little more than 2% per year.
- \n
- Global HIV incidence still stands at high 1.8 million as revealed by UNAIDS in its latest estimate.
- \n
- Certainly, it is hard to get to the global fast track targets of reduction of new infections by 85% by 2020.

- \n
- Also, logically, the goal of ending AIDS by 2030 appears much farther away.
- \n

\n\n

What does it call for?

\n\n

- \n
- The need of the hour is hard core programming for prevention, principally focussing on populations vulnerable to HIV.
- \n
- Prevention messages on responsible sexual behaviour and harm reduction should be taken to the masses.
- \n
- Global managers need to advocate equitable allocation of resources for preventing new infections and treatment of the affected.
