Regulations for boosting the innovations

What is the issue?

\n\n

Regulations are needed for the development of Pharma in India.

\n\n

What are Indian measures to promote innovation?

\n\n

\n
- India, recently signed an agreement with his Israel to create a $40 million innovation fund to connect innovators from India and Israel with larger R&D opportunities.
\n
- Funds has been allocated for Impacting research innovation and technology (IMPRINT) initiative.
\n
- India Innovation Index to rank Indian states on their innovative spirit, to create an innovation-centric economy for India.
\n

\n\n

Why Indian market is averting innovations?

\n\n

\n
- The ethos of innovation seem to lose with regulations prevailing in India.
\n
- Indian regulators routinely adopt strategies, including egregious ‘price control’ mechanisms which hinder the ability of the industry to innovate.
\n
- Price control measures deny an innovator the right to price goods in line with what the market will permit.
\n

\n\n

What is the status of Indian Pharma device industry?

\n\n

\n
- India has a $2.5 billion medical-device industry.
\n
- The growth rate of India’s medical-device industry is around 15% which is more than double of the global industry growth rate.
\n
- It is expected to become a $25-30 billion industry in India by 2025.
\n
- But,India spends a woeful little of only 0.9% of its GDP in bio-pharma research.
\n
- It is largely dependent on other countries for supply of pharmaceutical ingredients and medical devices.
\n

\n\n

What are the issues with Pharma R&D?

\n\n

\n
- In February, the NPPA (National Pharmaceutical Pricing Authority), ventured from drug pricing into medical device pricing.
\n
- It slashed prices of stents, a tube-like mesh placed to unblock arteries to maintain the heart’s blood supply by about 85%.
\n
- NPPA put all drug-eluting stents into a single category and price, with no consideration of innovations that have led the industry from first to the fourth generation of stents.
\n
- NPPA disallowed stent manufacturers from withdrawing their loss-making products from the market for at least six months to avoid any shortage.
\n
- This essentially means that stent manufacturers can neither decide the price nor the type of stents they can sell in India.
\n

\n\n

What is the need for moral regulatory practices?

\n\n

\n

- The absence of robust medical devices regulations in India may be the reason for NPPA’s current approach.
\n
- Price control is a blunt regulatory instrument and is not a substitute for genuine healthcare reform.
\n
- Regulatory trends by mandating price levels below market will cause such foreign suppliers to withdraw from the Indian market ultimately harming the Indian patients.
\n
- Countries like the US and the UK have their drug regulators.
\n
- They subject new devices to rigorous rounds of clinical trials, assessing their improvements and innovations before approving such devices.
\n
- NPPA need to re-imagine their regulatory strategies from policing price to that of nurturing innovation.
