

## **Rhesus Macaque**

**Prelims:** Current events of national and international importance | Conservation

## Why in News?

National Board for Wildlife's panel has recommended reinstating Rhesus Macaque species of monkeys under Schedule II of the Wildlife (Protection) Act, 1972.

- **Purpose** To restore statutory protection against illegal capture and cruelty, and to regulate scientific management.
- Scientific Name Macaca mulatta.
- **Rhesus Macaque** It is one of the most well-known and widespread species of Old-World monkeys.
- Native Range It is native to South, Central, and Southeast Asia, including countries like India, China, Pakistan, Nepal, Bangladesh, and Thailand.
- Habitat They thrive in diverse environments from arid grasslands and woodlands to mountainous regions and, notably, in urban and humanmodified landscapes.
- **Behavior** They are diurnal (active during the day), arboreal (tree-dwelling), and terrestrial (ground-dwelling).
- They are also known to be strong swimmers.
- Physical Characteristics
  - They are medium-sized monkeys.
  - $_{\circ}$  Males are generally larger than females.
  - $_{\circ}$  **Length -** About 47–64 cm (19–25 inches), excluding the tail.
  - $\circ$  **Weight** Males average around 7.7 kg (17 lb); females average about 5.3 kg (12 lb).11
- **Appearance** They have brown or grey-brown fur, and their face is typically a pink or pale reddish color, and is bare of fur.
- They have a moderately long, non-prehensile tail.

- **Diet** Rhesus Macaques are omnivores and their diet is highly flexible, adapting to their environment.
- **Social Structure** They are highly gregarious, living in multi-male/multi-female groups called troops, which can range in size from 20 up to 200 individuals (sometimes more in provisioned areas).
- **Communication** They are very vocal and use a variety of facial expressions, body postures, and gestures for complex social communication.
- **Significance** They play an important role in dispersing seeds, and many trees around us are because of the seed dispersal that happens because of their foraging and usual activities.
