

River Interlinking and the Threat of Invasive Species

Mains: GSIII – Infrastructure| Environment

Why in News?

India's National River Linking Project, covering 37 river basins through 30 links, aims to address water scarcity and generate hydropower. However, it may also facilitate the spread of invasive alien species and aquatic pathogens across river basins.

What is the National River Linking Project?

- **Scale of the project** – The project proposes transferring around 174 billion cubic metres of water from identified surplus to deficit basins.
- **Multiple objectives** – It aims to address water scarcity, improve irrigation, manage floods and generate hydropower.
- **Ecological concerns** – Dams, reservoirs and canals can alter river flows, sediment transport, fish migration, floodplains and aquatic habitats.
- **Climate change dimension** – Changing rainfall patterns and river flows may challenge the assumption that some basins will consistently remain water-surplus.

NATIONAL RIVER LINKING PROJECT (NRLP)

What is NRLP?

- A plan to interlink surplus rivers with deficit rivers across India through a network of reservoirs, canals, tunnels and linkages.
- Aims to transfer water from water-surplus basins (mainly Himalayan rivers) to water-deficit basins (mainly peninsular rivers).
- Conceived by the National Water Development Agency (NWDA) under the Ministry of Jal Shakti.

Objectives

- Address regional water imbalances.
- Enhance water availability for irrigation, drinking and industrial use.
- Reduce flood risks in flood-prone areas.
- Support drought-proofing of water-scarce regions.
- Augment hydropower generation.
- Improve inland navigation and connectivity.
- Conserve and manage water resources more efficiently.

Components

1. Himalayan Component

- Focuses on linking major rivers of the Himalayan system – Indus, Ganga and Brahmaputra.
- Aims to transfer surplus monsoon flows to water-deficit basins in the north and central India.
- Envisages storage of flood waters and better flood management.

2. Peninsular Component

- Proposes interlinking of west-flowing and east-flowing rivers of the peninsular India.
- Includes links such as Mahanadi–Godavari, Godavari–Krishna, Krishna–Cauvery, etc.
- Aims to address chronic water scarcity in peninsular regions.

Potential Benefits

Key Challenges

- Environmental concerns and ecological impacts on river basins.
- Displacement and rehabilitation issues.
- High financial cost and long gestation period.
- Inter-state water sharing disputes.
- Impact on biodiversity and river flow regimes.
- Sedimentation and maintenance challenges.
- Uncertainty over actual "surplus" water availability due to climate change.
- Social and political acceptance.

How River Interlinking can be an “Ecological Highway”?

- **Spread of Invasive Alien Species** – Inter-basin water transfers can carry invasive species into ecosystems where they are not naturally found.
- **Threat to Endemic Species** – Invasive species can outcompete native species, disrupt food chains and threaten endemic biodiversity.
- **Spread of Aquatic Pathogens** – Connected rivers can facilitate the spread of pathogens to species with limited resistance.
- **Disruption of Fish Migration** – Dams, canals and altered flows can disrupt fish migration, breeding and aquatic ecosystems.
- **Ecologically Vulnerable River Basins** – Peninsular and Northeastern basins are more vulnerable, with the Lower Ganga hosting 13-15 invasive species and the Mahanadi supporting 69 threatened species.

What are the Other Ecological Concerns?

- **Alteration of River Flows** – Water diversion can reduce downstream flows and threaten species dependent on natural river regimes.
- **Sediment Disruption** – River-linking structures can alter sediment transport and degrade downstream habitats and floodplains.
- **Fragmentation of Ecosystems** – Dams and canals can fragment aquatic habitats and disrupt ecological connectivity.
- **Impact on Livelihoods** – Ecological changes can adversely affect fisheries, agriculture and communities dependent on river ecosystems.

What are the Key Challenges Associated?

- **Limited Invasive Species Management** - India needs stronger systems for preventing, detecting and controlling invasive alien species.
- **Basin-Centric Planning** - River-linking must consider basin-level ecological characteristics rather than focusing only on water availability.
- **Uncertainty under Climate Change** - Changing rainfall and river flows make fixed surplus-deficit classifications increasingly uncertain.
- **Limited Ecological Assessment** - Project assessments must consider cumulative impacts on biodiversity, pathogens, sediment and downstream ecosystems.

What could be done?

- **Strengthen Environmental Impact Assessment** - Conduct comprehensive basin-level assessments covering biodiversity, invasive species and downstream impacts.
- **Develop an Invasive Species Management Framework** - Establish mechanisms for prevention, early detection, rapid response and control of invasive species.
- **Adopt Basin-Level Planning** - Integrate ecological flows, biodiversity and long-term water availability into river-linking decisions.
- **Establish Biosecurity Measures** - Introduce safeguards and continuous monitoring to prevent the movement of invasive species and pathogens.
- **Integrate Climate Change into Planning** - Account for changing rainfall, droughts, floods and future water availability in river-linking projects.
- **Promote Nature-Based Solutions** - Prioritise watershed management, rainwater harvesting, aquifer recharge, wetland conservation and demand-side management.

Conclusion

- River interlinking can contribute to water management and regional development, but its ecological consequences require careful consideration.
- Water cannot be treated merely as a transferable resource; rivers are complex ecosystems supporting biodiversity and livelihoods.
- A scientifically informed approach based on basin-level planning, and climate-resilient water governance is essential for balancing developmental objectives with ecological security.
