

## **Weakening Emerging Market Currencies**

### **What is the issue?**

\n\n

Many of the emerging market economies' currencies including that of India are weakening against the U.S. dollar.

\n\n

### **What are the recent developments?**

\n\n

\n

- The Indian rupee weakened past the 71 mark for the first time recently.
- It has registered a loss of about 10% of its value against the dollar since the year's beginning.
- This makes the rupee the worst-performing currency in Asia.
- Other emerging market currencies too have suffered much larger losses.
- They, notably, include the Turkish lira, the Argentine peso and the South African rand.
- The Argentine peso has lost more than half of its value in 2018.
- It witnessed a sharp loss of more than 10% on a single day.
- This happened despite a 15 percentage point increase in interest rates by Argentina's central bank.
- It was an effort to stem the outflow of capital and shore up the value of the currency.

\n

\n\n

### **What are the causes?**

\n\n

\n

- **External** - A common factor is the increasing demand for the dollar across the globe.

\n

- The U.S. Federal Reserve raised the interest rates earlier this year (2018).

\n

- The resultant tightening of liquidity in the West has played a major role in strengthening of the dollar.

\n

- Emerging market countries earlier benefited from the West's easing of monetary conditions.

\n

- These are now facing the impact of a return to the West's tight monetary policy.

\n

- Investors who earlier put their money in emerging markets have recently preferred American assets.

\n

- As, this has become more attractive now yielding higher returns. Click [here](#) to know more.

\n

- **Domestic** - Emerging market economies cannot simply blame external economic factors.

\n

- The management of these economies has generally been far from ideal.

\n

- This is particularly true when it comes to hard-hit economies like Turkey and Argentina.

\n

- A key trouble of emerging market economies is the higher domestic inflation in relation to the economies in the West.

\n

- So it is natural that their currencies slide in value over time against the dollar and other major Western currencies.

\n

\n\n

## **What is the way forward?**

\n\n

\n

- Shift of capital across the globe due to interest rates variations is normal.

\n

- There is need for a drastic change in emerging markets' monetary policy as against that of the West.  
\n
- The role of emerging markets' central banks in the current scenario is crucial.  
\n
- Their mandate should be to let their currencies find their true value in a smooth manner.
