

World Malaria Report 2018 - Odisha's Progress

Why in news?

\n\n

Odisha's performance pushed down India's malaria count for 2017 according to World Health Organization's World Malaria Report 2018.

\n\n

What are the highlights of the report?

\n\n

\n

- As per the report, in 2017, 11 countries accounted for roughly 70% of estimated malaria cases and deaths globally.

\n

- Apart from India, 10 of these countries are in sub-Saharan Africa.

\n

- Among these countries, only India reported progress in reducing its malaria cases in 2017 compared to 2016.

\n

- By 2017, India accounted for 4% of the global burden of malaria morbidity.

\n

- It accounted for 52% of deaths outside of the WHO African Region, despite "impressive gains".

\n

- India registered three million fewer cases which is a fall of 24% in cases from 2016 to 2017.

\n

- It is largely due to substantial declines of the disease in the highly malarious state of Odisha.

\n

- Notably, Odisha is home to approximately 40% of all malaria cases in the country.

\n

\n\n

What were Odisha's notable measures?

\n\n

\n

- Malaria cases in Odisha have been coming down steadily since 2003, with a marked reduction since 2008.

\n

- The number of cases in July-December 2017 period fell by nearly 50%, compared to the same period in 2016.

\n

- The report commends the Odisha government for its rigorous training to detect, treat and also to prevent malaria outbreaks.

\n

- The state did pioneering effort to upgrade skills of health workers, and the Self Help Group by its #MissionShakti initiative.

\n

- A notable aspect of Odisha's approach is its network of Accredited Social Health Activists or ASHAs.

\n

- They served as front-line workers to deliver essential malaria services across the state, particularly in rural and remote areas.

\n

- Success factors include rejuvenated political commitment and strengthened technical leadership.

\n

- Efforts focused on prioritizing the right mix of vector control measures and increased levels of domestic funding to back them.

\n

- Large-scale distribution of insecticide-treated bednets was taken up.

\n

- Also, strategies to encourage health-seeking behaviour have paid off in the state.

\n

\n\n

What are the concerns to be addressed?

\n\n

\n

- One issue that requires monitoring in India is resistance to combination therapy.

\n

- Recent reports indicate that some patients in West Bengal became resistant to the treatment protocol used for the falciparum parasite.

\n

- Falciparum parasite causes debilitating cerebral malaria and leads to a high

number of deaths.

\n

- Emerging resistance to treatment has been reported in Myanmar, among other countries in this belt.

\n

- So there is a need for a coordinated approach to rid southern Asia of malaria.

\n

- WHO said in a recent assessment that the treatment policy was changed to another efficacious set of combination drugs in some north-eastern States.

\n

- Nevertheless, the phenomenon requires close monitoring.

\n

\n\n

What lies ahead?

\n\n

\n

- India has suffered from a major burden of malaria for decades, with high levels of morbidity and death.

\n

- But the report noted that India's record offered great promise in the quest to cut the number of new cases and deaths.

\n

- At this rate, malaria can be reduced globally by at least 40% by 2020, and the epidemic could end by 2030.

\n

- Eliminating malaria requires an integrated approach, involving states with a higher burden of the disease - Chhattisgarh, Jharkhand and West Bengal.

\n

- Odisha's positive trend should encourage authorities in other states too to further cut disease transmission.

\n

- Its experience with using public health education as a tool and reaching out to remote populations with advice needs to be replicated.
