

in the context of Renewable energy and a net-zero target, there is a gap between the announcements & the ground Reality. Do you agree with this view? Critically Analyze.

The proverb "Action Speaks louder than words" would be ideally suit for this action in the recent time on COP 26 - Glasgow India has announced Net Zero on 2070; 500 GW of Renewable energy, 50% Power from Renewable source, cutdown on 1 billion carbon emission by 2030.

All its well and good which is soon achievable in the coming future, but the country has complied to treaty in letteric manner.

History: i) Kyoto protocol → developed country walked out
ii) Paris Agreement → developed country walked out
Now, COP
iii) Glasgow -26 → Announced same as Previous times.

- The developed countries still has its eye on development than saving earth since lack of technology shortage
- The funding is only an announcement, hasn't complied on funding
- The ruling parties are more interested in Flashy develop-ment policy which will keep them in power than Saving Earth
- The developed country was developed by polluting now wants the developing country to stop pollution, There is a difference between luxury pollution & survival pollution.
- with all this we cant just push the COP-26 as a failure before most country didnt even start toward zero emission, now major countries have started. As it is told "A million mile journey starts with single step" So its not all bad.
